

# Enhance your Office 365 Data Protection with Zivver

Use Zivver's integrated platform to safeguard your sensitive email data when using Office 365 through more robust encryption, strong recipient authentication, advanced risk monitoring and data breach prevention tools.

## 01 Enable staff to protect sensitive information and comply with regulatory requirements

Employees are the frontline of defense when it comes to data protection, that's why you should give them tools to enable them to do this more effectively, from anywhere and on any device. Zivver's out-of-the-box classifiers and customized business rules make it easy for people to select the appropriate level of protection to adhere to your organization's data policies when emailing or sending files, whether they are in the office or home working.

## 02 Prevent misaddressed emails more easily

Zivver's advanced threat detection software can identify potential data leaks in communications before the user hits send, enabling them to take immediate corrective action and avoid the most common forms of data breaches, such as emailing the wrong person or sending an incorrect attachment.

Zivver was recently identified as one of five representative vendors in the 'Email Data Protection Specialists' category in Gartner's '2020 Market Guide for Email Security'.

## Ensure only you can access your data, and not the vendor

Unlike Office 365 and many other cloud providers, Zivver cannot access data that is stored on its platform as it doesn't have access to the user keys to decrypt the information. Built with zero-access encryption, blind government summons for data, for example, are effectively useless since the information won't be recoverable.

## Revoke sent messages and see who already read a message

Despite best efforts, mistakes when emailing are bound to happen, everyone messes up now and again. If this happens while using Zivver, the user can swiftly revoke access to the message and determine whether the communication has already been read. This can prevent costly data breaches and provides additional mitigation tools to use when these situations arise.

## Save on costs compared to standalone Office 365 E5 licenses

Enterprises currently have three choices when it comes to Office 365 packages, E1, E3 and E5 licenses. By using Zivver's integrated platform in combination with an Office 365 E1 or E3 license, you'll have the added benefits of enhanced security and data protection, at a more cost-effective rate than with an E5 license alone.

## User authentication ensures that only intended recipients can access sensitive data

The best way to assure that only intended recipients can access sensitive information sent to them is to have strong user authentication in place as an extra layer to confirm their identity before granting access to the information. Zivver provides this functionality with two-factor authentication via SMS or with an access code from apps like Google Authentication. Zivver also provides the option of working with a verification email and delivering emails via the DANE email security protocol.

## Easy installation, configuration and maintenance

Using Office 365 alone, many find data classification to be a cumbersome process entailing regular maintenance. With Zivver, this entire process is simplified and the rules can be easily adjusted. The service can be deployed quickly with minimal maintenance required.

## Reduce time spent on staff training

Zivver's platform is intuitively designed to gently guide users in properly securing their communications before they hit send. This includes ensuring that the correct security measures are applied, as well as providing safeguards to help users avoid the most common forms of data breaches. The service can be up and running quickly and integrates seamlessly with Office 365. It really is that simple.
